

SH-Mobile ARM zboot

Japan Technical Jamboree 37

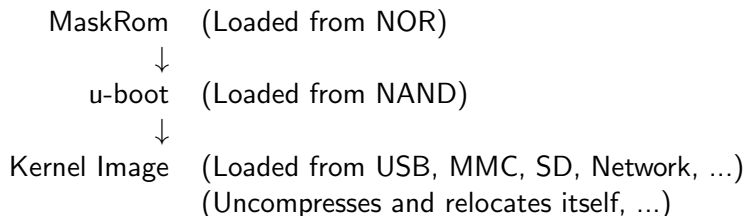

Simon Horman <simon@horms.net>
Horms Solutions Ltd., Tokyo

20th May 2011

- SH-Mobile ARM is an ARM platform developed by Renesas
- Target for this work is the AP4EB and Mackerel boards
- Default boot loader is u-boot
- Would like to boot directly to linux;
- Or use Linux as a boot loader (kexec)

- Prove Hardware
- Provide options for customers
- Upstream first policy

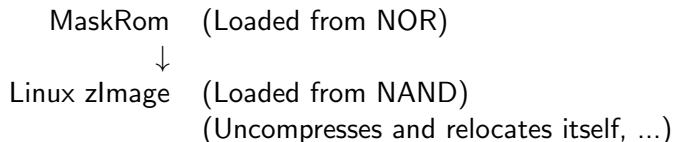

Boot Sequence with u-boot on NAND

Goal 1: Boot zImage from NAND

- NAND zboot support has been merged into 2.6.38-rc1
- Success...
...but end users generally can't flash the NAND.

Boot Sequence with zboot on NAND

zboot from NAND: Loaded

- MaskRom copies the zImage to SDRAM;
- And and jumps to it

zboot from NAND: Uncompressed

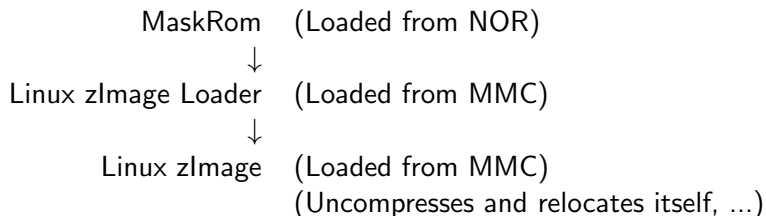

- zimage Loader uncompresses the Kernel;
- And jumps to it

Goal 2: Boot zImage from MMCIF

- MMCIF is a hardware block that accesses MMC cards
- MMCIF zboot support merged into 2.6.39-rc1
- A hardware-hack is required, unfortunately this is not generally available.

Boot Sequence with zboot on MMCIF

zboot from MMCIF: Loaded (1)

- MaskRom copies the zImage Loader to SDRAM;
- And jumps to it

zboot from MMCIF: Loaded (2)

- zimage Loader copies the entire zimage to SDRAM;
- And jumps to the next instruction in the loader in the new location

zboot from MMCIF: Uncompressed

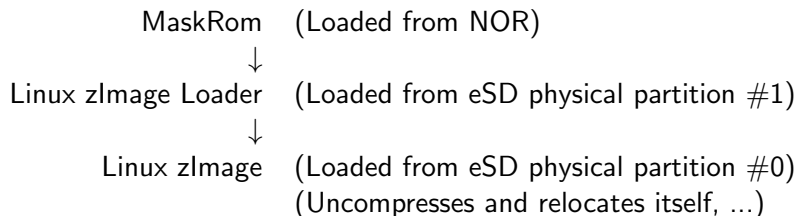

- zImage Loader uncompresses the Kernel;
- And jumps to it

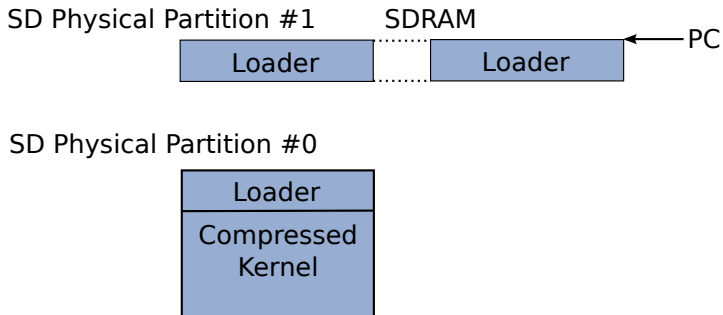

Goal 3: Boot zImage from SDHI

- SDHI is a hardware block that accessed SD and MMC cards
- Complete — Aiming merge in 2.6.40-rc1
- An eSD card is required, unfortunately this is not generally available.

Boot Sequence with zboot on SDHI

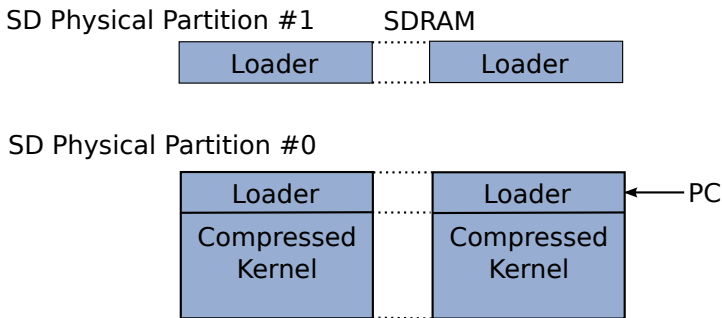

zboot from SDHI: Loaded (1)

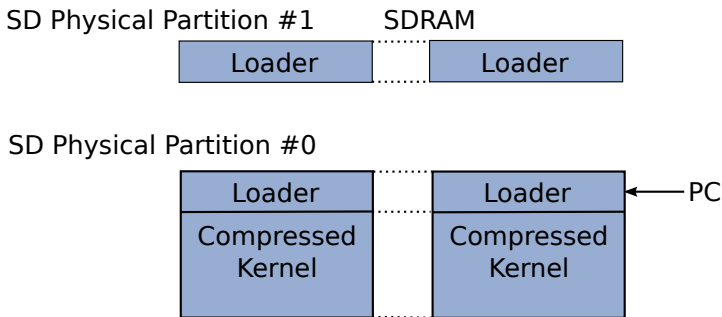

- MaskRom copies the zImage Loader to SDRAM;
- And jumps to it

zboot from SDHI: Loaded (2)

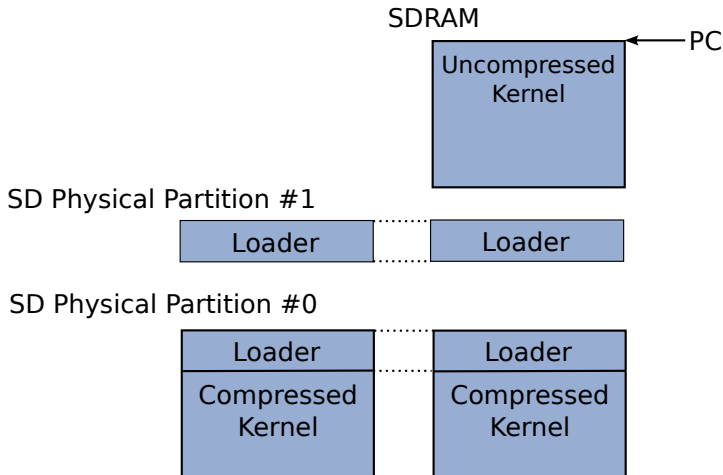

- zimage Loader copies the entire zimage to SDRAM;
- And jumps to the next instruction in the loader in the new location

zboot from SDHI: Loaded (2) (cont)

- Physical partition #0 is used as the maximum size of physical partition #1 is 128kb.
- Partition #0 requires a partial copy of the zImage that is in partition #1
- A better boot protocol, possibly a self-contained loader in partition #0 would be nice – a progression of the approach taken for MMCIF

zboot from SDHI: Uncompressed

- zImage Loader uncompresses the Kernel;
- And jumps to it

- zboot on APE5REV
